Homework 5 | Math 342 | Cruz Godar

*Due Wednesday of Week 6 at the start of class*

Complete the following problems and submit them as a pdf to Canvas. 8 points are awarded for thoroughly attempting every problem, and I'll select three problems to grade on correctness for 4 points each. Enough work should be shown that there is no question about the mathematical process used to obtain your answers.

## Section 4

In problems 1–3, use the Gram-Schmidt process to produce an orthonormal basis for the given subspace  $X$ .

Then find the orthogonal decomposition of given vector  $\vec{v}$  as  $\vec{v} = \vec{x} + \vec{x}'$  for  $\vec{x} \in X$  and  $\vec{x}' \in X^\perp$ .

$$1. X = \text{span} \left\{ \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \\ 4 \end{bmatrix} \right\} \text{ and } \vec{v} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}.$$

$$2. X = \text{span} \left\{ \begin{bmatrix} 2 \\ -4 \\ 1 \\ 3 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 2 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 2 \\ 6 \end{bmatrix} \right\} \text{ and } \vec{v} = \begin{bmatrix} -1 \\ 1 \\ 0 \\ 3 \end{bmatrix}.$$

$$3. X = \text{span} \left\{ \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \\ 0 \end{bmatrix} \right\} \text{ and } \vec{v} = \begin{bmatrix} -1 \\ 1 \\ 0 \\ 3 \end{bmatrix}.$$

In problems 4–5, find the closest vector  $\vec{x} \in X$  to  $\vec{v}$ , and compute the distance between the two.

$$4. X = \text{span} \left\{ \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix} \right\} \text{ and } \vec{v} = \begin{bmatrix} 3 \\ 1 \\ 4 \end{bmatrix}.$$

$$5. X = \text{span} \left\{ \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} \right\} \text{ and } \vec{v} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}.$$

6. Let  $A = \begin{bmatrix} 1 & -1 \\ 2 & 1 \\ 0 & 4 \end{bmatrix}$  be the matrix whose columns are the basis vectors from problem 1. By using the data from the Gram-Schmidt process, write  $A = QR$  for a  $3 \times 2$  unitary matrix  $Q$  and a  $2 \times 2$  upper triangular matrix  $R$  whose eigenvalues are all positive. This is known as a **QR factorization** of  $A$  — write a brief sentence explaining why this is always possible for a matrix with linearly independent columns.

7. Find a  $QR$  factorization of  $A = \begin{bmatrix} 2 & 1 & 0 \\ -4 & 1 & 1 \\ 1 & 1 & 2 \\ 3 & 2 & 6 \end{bmatrix}$ .

8. Find a  $QR$  factorization of  $A = \begin{bmatrix} 0 & 1 \\ 1 & 1 \\ 0 & 0 \\ 1 & 0 \end{bmatrix}$ .

9. Let  $X$  be a subspace of  $\mathbb{R}^n$ . What is the kernel of the map  $\text{proj}_X$ ? (This should be a brief answer.)
10. True or false: for any subspace  $X$  of  $\mathbb{R}^n$  and any  $\vec{v} \in \mathbb{R}^n$ ,  $\|\text{proj}_X(\vec{v})\| \leq \|\vec{v}\|$ . If true, briefly explain why, and if not, provide a short counterexample.
